de Navarra

Cancer  
Center

**The Cancer Center Clínica Universidad de Navarra (CCUN) is the oncology center at the University of Navarra that integrates – in its two locations in Pamplona and Madrid – the healthcare provision, research, and teaching activity in Oncology of the entire University of Navarra.**

**It began its journey in 2017**, as a joint venture between the Clínica Universidad de Navarra, the Centre for Applied Medical Research (Cima), the Medicine, Nursing, Sciences, Pharmacy faculties, and the Tecnum School of Engineering, all at the University of Navarra. The project now represents the evolution of more than 40 years of experience in cancer at the University of Navarra.

# FOREWORD

The year 2023 has been a very special year for the Cancer Center Clínica Universidad de Navarra. It will stay in our memories because of the public presentation of an exciting project: firstly, at the end of January we brought together, in Pamplona, all the specialists and researchers from the centers of the University of Navarra that make up the CCUN and then, on the 2nd of February – taking advantage of the World Cancer Day – we put on a gala in Madrid, bringing together authorities, colleagues from public and private hospitals, scientific and patient associations, parties from industry and technological backgrounds, pharmaceutical companies, donors, and the media.

We want to be a comprehensive cancer center, with quality care, teaching, and research excellence. This first edition of the scientific report allows us to summarize the fruits of the constant and patient work undertaken by our translational researchers, mainly in the Cima Universidad de Navarra, and of the efforts of the Clinic's specialists to understand more about disease and find better cures, all integrated into the one overarching aim of the Cancer Center Clínica Universidad de Navarra..

We already have 43 research groups, all working with a common goal: to better understand cancer in order to care for patients in a more personalized way, improving their quality of life and achieving a cure. These groups are engaged in almost 170 lines of research and in 2023, they obtained funding for 75 new projects and published their progress in 280 scientific articles in international journals.

If in January and February we presented ourselves in Pamplona and Madrid, in June we went to Paris to make ourselves known to our European counterparts from the Organization of European Cancer Institutes (OECl), which integrates more than 70 institutions dedicated to oncological research and the provision of care. We returned with the joy of being a member of an institution that brings together all the European cancer centers and with a drive that, since then, has guided us to obtain the accreditation for the Cancer Center Clínica Universidad de Navarra as a comprehensive cancer center, something that will help us – just like our quiet and irreplaceable research work – to offer our patients the best outcomes for their illnesses.

**Dr. Antonio González**

Director of the Cancer Center Clínica Universidad de Navarra

# 1. THE CANCER CENTER CLÍNICA UNIVERSIDAD DE NAVARRA

## 1.1. Organizational chart

The Cancer Center Clínica Universidad de Navarra is the oncology center of the University of Navarra and adheres to the **comprehensive cancer center model**. Its mission is to integrate, coordinate, and enhance – adhering to the most demanding international standards – all the cancer-related care, research, and teaching activity that takes place in the Clinic, Cima, and other centers in the University of Navarra such as the biomedical and health area faculties, the Culture and Society Institute (ICS), TECNUN School of Engineering, and the Institute of Data Science and Artificial Intelligence (DATAi).

Having joined the **European Organization of Cancer Institutes (OECI)** in June 2023, the CCUN is now recognized as a ‘Center of Research Excellence’ by the **Scientific Foundation of the Spanish Association Against Cancer**.

This panel is governed by a **General Council**, chaired by María Iraburu (rector of the University of Navarra), which includes Paloma Grau (vice-rector for Research and Sustainability), Joseba Campos (general director of the Clínica Universidad de Navarra), José Andrés Gómez Cantero (general director of the Cima Universidad de Navarra), Esperanza Lozano (director of the Clínica Universidad de Navarra in Madrid), and Marta Ferrer (dean of the Faculty of Medicine).

## I. CCUN GOVERNING BODIES

### A. EXECUTIVE COMMITTEE

#### **Permanent Committee:**

Antonio González  
(director)  
José María Gutiérrez  
de Cabiedes (executive  
director)  
Rubén Pío  
(scientific director)  
Gabriel Canel  
(research manager)  
María Ángeles Soferas  
(director of the Nursing  
Area)  
Rafael Martínez Monge  
(spokesperson)

#### **Committee Members:**

Jorge Baixauli  
Felipe Calvo  
María Dolores Lozano  
Antonio Pineda-Lucena  
Felipe Prósper  
María Rodríguez  
Javier Rodríguez  
Bruno Sangro  
José Luis Pérez Gracia  
Josepmaría Argemí  
Mariano Ponz  
Eduardo Castañón  
Gabriel Canel  
José María Gutiérrez  
de Cabiedes

### B. INTERNAL SCIENTIFIC COMMITTEE

Jesús San Miguel  
(president)

Rubén Pío  
(scientific director)  
Ana Fortuño (secretary)

#### **Members:**

Antonio González  
Juan José Lasarte  
Ignacio Melero  
Matías Ávila  
Felipe Prósper  
Antonio Pineda-Lucena  
Cristian Smerdou  
Bruno Paiva  
Luis Montuenga  
Marta Alonso  
Maite Huarte  
Mikel Hernández  
Bruno Sangro  
Ana Patiño  
Rafael Martínez Monge  
Julián Sanz  
José Luis Pérez Gracia  
Josepmaría Argemí  
Mariano Ponz  
Eduardo Castañón  
Gabriel Canel

### C. EXTERNAL SCIENTIFIC AND ADVISORY COMMITTEE

This committee is made up of scientists and high-level professionals with complementary knowledge who advise on the definition of the center's strategy and evaluate the progression of the different areas of the Cancer Center.

Jean Charles Soria  
Ignace Vergote  
Guido Kroemer  
Josep Tabernero  
Begoña Barragán García  
Cristina Ruiz Ortega  
Cristina Garmendia  
Mendizábal  
Kurt Schalper  
Kenneth C. Anderson  
Vincenzo Valentini

## 1.2. Multidisciplinary areas

The Clínica Universidad de Navarra Cancer Center organizes clinical care for tumors through fourteen multidisciplinary areas that include the professionals, services, and departments involved in the diagnosis, treatment, and research of each of these tumor types at the two locations.

Each area has specific care protocols in place and integrates a personalized medicine program adapted to each one, as well as basic and translational research projects, a line of clinical trials and retrospective case registration, and in areas where it is appropriate, hereditary cancer programs.

### AREAS

Head and Neck Cancer Area  
Gynecological Cancer Area  
Gastrointestinal Cancer Area  
Hematological Cancer Area  
Liver and Pancreas Cancer Area  
Breast Cancer Area  
Pediatric Cancer Area  
Skin Cancer and Melanoma Area  
Prostate Cancer Area  
Lung Cancer Area.  
Thyroid Cancer and Endocrine Tumor Area  
Urological Cancer Area  
Sarcoma Area  
Central Nervous System Tumor Area

## 1.3. Research

The research areas of the CCUN are disease-oriented and involve the functional collaboration of multidisciplinary scientific teams that work with a translational approach.

### AREAS

- Gynecological Cancer Research Area
- Breast Cancer Research Area
- Melanoma and Non-Melanoma Skin Cancer Research Area
- Neuro-Oncology, Sarcomas, And Pediatric Tumors Research Area
- Onco-Hematology Research Area
- Respiratory Tract Tumor Research Area
- Liver And Digestive Tumor Research Area
- Urological Tumor Research Area

### GROUPS

The research work is carried out through **43 groups** (35 consolidated, 6 emerging, and 2 associated clinical groups).

Group	Principal investigator	Co-Principal investigator
Adhesion and Metastasis	Fernando Lecanda Cordero	Rafael Martínez-Monge
Aptamer Cancer Therapeutics	Fernando Pastor Rodríguez	
Computational Biology	Angel Rubio Díaz-Cordovés	
Biomaterials and Nanomedicine	Maria J Blanco Prieto	
Selenated Derivatives as Cancer Therapies, Trypanosomes and other Pathologies	Carmen Sanmartín Grijalba	Daniel Plano Amatriain
Vaccine Development	Pablo Sarobe Ugarriza	
Digital Medicine Lab	Rubén Armañanzas Arnedillo	
Dynamics of the Anti-Tumor Immune Response	Álvaro Teijeira Sánchez	
Epidemiology and Public Health	Miguel Ángel Martínez González	
Tumor Escape and New Targets	Juan Dubrot Armendáriz	
Combined Translational Immunotherapy Strategies	Ignacio Melero Bermejo	
Medical Physics and Biophysics	Javier Burguete Mas	Juan Diego Azcona Armendáriz
CCUN Pancreatobiliary Cancer Group	Silve Vicent	Mariano Ponz Sarvisé
Prostate Cancer Research Group	Bernardino Miñana López	
Breast Cancer Research Group	Marta Santisteban Eslava	
University of Navarra Lymphoma Group	José Ángel Martínez Climent	Sergio Roa Gómez
Renal and Urothelial Tumors Group	Felipe Villacampa Aubá	Daniel Sánchez Zalabardo

Group	Principal investigator	Co-Principal investigator
Translational Hematology	Felipe Prósper Cardoso	
Hepatology: Carcinogenesis	Carmen Berasain Lasarte	Maria Arechederra Calderón
<i>Immunotherapy Strategies in Peritoneal Carcinomatosis</i>	Fernando Aranda Vega	
Translational Immunomics in Hematological Neoplasms	Bruno Paiva	
Immunomodulation and the Tumor Microenvironment	Juan José Lasarte Sagastibelza	Teresa Lozano
Innovation for the Promotion of Family and Community Health	Navidad Canga Armayor	
Innovation for Person-Centered Care	Ana Carvajal Valcárcel	Maddi Olano Lizarraga
<i>Interdisciplinary Theragnosis and Radiomics</i>	Felipe A. Calvo Manuel	
<i>Machine Learning for Biomedicine</i>	Mikel Hernaez Arrazola	
Palliative Medicine	Carlos Centeno Cortés	María Arantzamendi Solabarrieta
Metabolism, Epigenetics, and Liver Cancer	Matías Antonio Ávila Zaragozá	Maite García Fernández de Barrena
Myelodysplastic Neoplasms	Irene Gañán Gómez	
Neuro-Oncology, Sarcomas, and Pediatric Tumors	Jaime Gállego Pérez de Larraya	Marta M Alonso Roldán
<i>Non-Coding RNA and the Cancer Genome</i>	Maite Huarte Martínez	
Obesity and Cancer	Gema Frühbeck Martínez	Victoria Catalán Goñi
Applied and Translational Onco-Immunology	Miguel Fernández de Sanmamed Gutiérrez	
Hepatic Oncology	Bruno Sangro	
Translational Oncology	Rubén Pío Osés	Antonio González Martín
Medical Chemistry	Antonio Pineda-Lucena	
<i>Screening, Early Detection, Biomarkers, and New Therapeutic Targets in Lung Cancer</i>	Luis Montuenga Badía	Luis Seijo Maceiras
Microphysiological Systems and Quantitative Biology	Carlos Ortiz de Solórzano Aurusa	
Adoptive Cellular Therapy	Sandra Hervás Stubbs	
Cancer Gene Therapy	Cristian Smerdou Picazo	
Gene Therapy in Hereditary Tumors	Gloria González Aseguinolaza	
Cytokine-Based Therapies	Pedro Berraondo López	
<i>Therapeutic Non-Coding RNA and Integrated Stress in Cancer</i>	Puri Fortes Alonso	Josepmaría Argemí Ballbe

The efforts of all the groups have manifested in the elaboration of **168 different lines of research**.

## 1.4. CCUN data from 2023

### 1.4.1 Professionals

**518**  
professionals

- 199 Cima
- 194 Clínica Universidad de Navarra
- 30 Faculty of Nursing
- 20 Faculty of Pharmacy and Nutrition
- 14 Faculty of Medicine
- 11 Faculty of Science
- 11 ICS - Culture and Society Institute
- 8 IdiSNA - Navarra Health Research Institute
- 7 DATAi - Institute of Data Science and Artificial Intelligence
- 7 Cima LAB Diagnostics
- 5 Tecnun - School of Engineering
- 4 CIBER - Centre of Networked Biomedical Research
- 8 Others

Professional profiles

**281**  
doctors

**107**

**Viva date:** 20 December 2023

### 2.4.3 Accolades

**The CRIS Against Cancer Foundation finances three research projects with more than 3 million euros**

*"We work so that research has more resources to carry out studies, tests, and projects, with the commitment of civil society. We promote the vocation of medical researchers."*

Marta Cardona, director of the CRIS Against Cancer Foundation

Three research programs have received €3,180,000 in grants in recent years from the Cancer Research Innovation Science (CRIS) Against Cancer Foundation, an independent organization that raises funds to support research in Spain, the UK, and France. The projects focus on the study of melanoma, multiple myeloma, and lung, ovarian, and kidney cancer and are directed by doctors Bruno Paiva, María Rodríguez, and Miguel Fernández de Sanmamed.

**CCUN research into the most aggressive pediatric brain tumor receives the II Dr. Baselga Scholarship**

*The FERO Foundation reminds us that "very few children with this diagnosis survive beyond the second year, which highlights the urgent need to find a more effective and long-lasting treatment."*

Dr. Marta Alonso, researcher in the Pediatric Cancer Area, has received the II Dr. Baselga Scholarship, the most important grant awarded by the FERO Foundation, which promotes the development of translational oncological research. This €300,000 grant will be used to finance research into diffuse midline glioma, work that Dr. Alonso directs in the Laboratory of Advanced Therapies for Pediatric Solid Tumors at the Cima Universidad de Navarra.

**Dr. Jaime Gállego receives the award for best research project of the year from the European Association of Neuro-oncology**

*"It is a recognition for patients who participated in the study and for their families, and is the work of a very large team that labors tirelessly to cure children and adults with brain tumors."*

The European Association of Neuro-oncology (EANO) has awarded its annual research award to Dr. Jaime Gállego Pérez de Larraya, coordinator of the Central Nervous System Tumors Area and co-director of the Cima Laboratory of Advanced Therapies for Pediatric Solid Tumors, for a project offering potentially promising results in terms of the survival of children with brainstem glioma, a pediatric brain tumor with a poor prognosis.

The research results of this team of medical specialists and translational researchers from the Clínica Universidad de Navarra and Cima were published in the New England Journal of Medicine. The judges valued not only the quality of the publication, but also the overall career of Dr. Gállego.

**SEOM rewards the training, work, and research of three young oncologists from the CCUN**

*The scientific society has awarded the "Somos Futuro" (We are Future) prize to Dr. Anna Vilalta, the "Doctoral thesis for young researchers" award to Dr. Ignacio Matos, and a scholarship to Dr. Alejandro Gallego to launch a research project to investigate endometrial cancer.*

The Spanish Society of Medical Oncology (SEOM) has awarded prizes and a research grant to three young CCUN specialists during its recent conference held in Barcelona. This is a series of distinctions intended to reward the work of Medical Oncology resident doctors based on their educational and professional merits and the completion of doctoral theses on topics related to oncology and precision medicine.

**Dr. Ignacio Melero,  
XX Burdinola  
Research Prize**

*His most notable contributions have focused on immunotherapy strategies based on the 4-1BB (CD137) receptor and his pioneering work on immunotherapy for hepatocarcinoma, which has transformed medical practice*

Dr. Ignacio Melero has been awarded the XX Burdinola Research Award, a prize that recognizes his career in translational research in cancer immunotherapy.

Since 1998, Dr. Melero has led a multidisciplinary team at the Cima Universidad de Navarra that works on immunotherapy with cell therapy techniques, gene therapy, and monoclonal antibodies. He combines his research activity at the CCUN and the Oxford Centre of Immuno-Oncology (OXCIO), a new center attached to the Departments of Medicine and Oncology at the British university

.

**The BBVA Leonardo Scholarship for Dr. Alvaro Teijeira**

*Thanks to this grant, he will study a new biological drug that improves the effectiveness of immunotherapy.*

UA project by Dr. Alvaro Teijeira Sánchez, researcher at the Cima Immunology and Immunotherapy Program, has been awarded one of the 58 Leonardo Scholarships from the BBVA Foundation program (which had received more than 1,100 applications) to promote research and cultural creation.

His project focuses on studying a new biological drug that improves the effectiveness of immunotherapy against cancer. "Many patients do not respond to cancer immunotherapy because of a lack of adequate immune cell infiltration into tumors. So, our objective is to generate a new type of biological drug that facilitates the entry of specific antitumor immune cells and sensitizes tumors to current immunotherapies," explained Dr. Teijeira.

**The European Federation of Immunology Societies awards an Excellence Scholarship to the researcher in training, Ángela Bella**

Ángela Bella, a PhD student in the Cima Immunology and Immunotherapy Program, has received the Mobility Scholarship awarded by the European Federation of Immunology Societies to promote the training of young researchers at institutions in the European Union. She is one of the two Spanish students who received this scholarship in this call, in which a total of ten excellence scholarships were awarded.

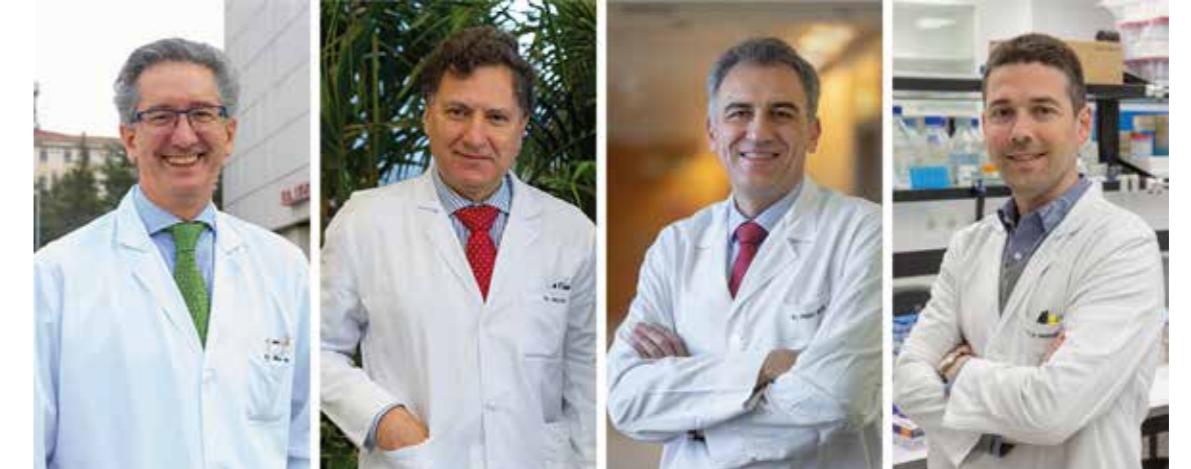

Ángela Bella will move to the Department of Oncology at the University Medical Center (UMC) in Amsterdam (Netherlands) to study new strategies for the treatment of peripheral metastases.

**Four doctors are among the most cited researchers in the world**

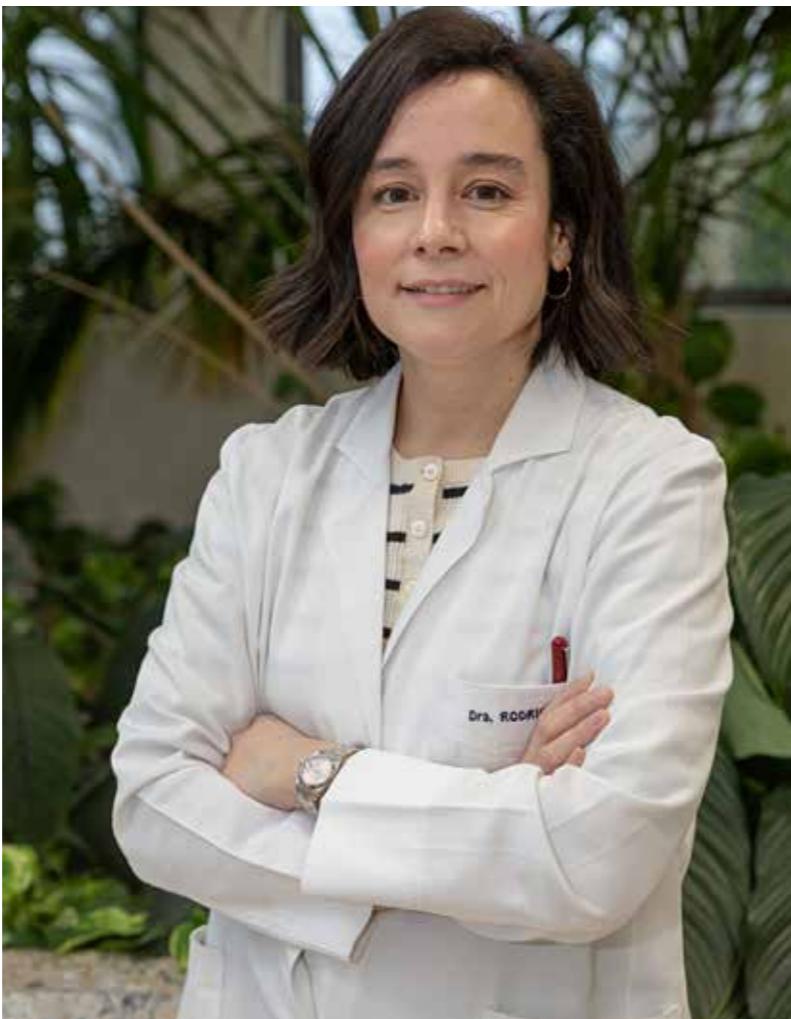

*'Highly Cited Researchers' is a prestigious list prepared by Clarivate Analytics. In the 2023 edition, it recognized 7,125 scientists from 6 countries, which included 104 Spaniards.*

Doctors Jesús San Miguel, Ignacio Melero, José Luis Pérez Gracia, and Miguel Fernández de Sanmamed appeared in the latest edition of the 'Highly Cited Researchers' list of the most cited scientists in the world. The list includes Dr. San Miguel and Dr. Melero for the fourth consecutive year and Dr. Pérez Gracia for the second time, while Dr. Fernández de Sanmamed appears for the first time.

**Dr. Rodríguez Otero gives an educational session at the American Medical Oncology Association conference.**

*"CAR-T therapy has demonstrated great efficacy in the treatment of patients who have exhausted the usual therapeutic alternatives and earlier lines of treatment."*

Dr. Paula Rodríguez Otero, specialist in the Hematological Cancer Area, has presented an educational session at the annual American Association of Medical Oncology (ASCO) conference in Chicago, the most important meeting in the world for this specialty. The specialist explained the latest clinical results available with CAR-T cell therapy in different patient populations with an unmet clinical need and where standard treatments offer more modest results.

**La Sexta rewards the scientific career of Jesús San Miguel**

*Dr. San Miguel was the Director of Clinical and Translational Medicine at the University of Navarra (2013–2023). In 2021, he received the Gregorio Marañón National Research Award. He is the author of more than 950 articles in the most important scientific journals and 120 book chapters and monographs.*

Dr. Jesús San Miguel, senior consultant at the CCUN, has received the Constantes y Vitales Award for Biomedical Research and Prevention in Health from Diana Morant, Minister of Science and Innovation. This is the ninth year the awards have been given by the television network La Sexta and the AXA Foundation, which Dr. San Miguel can now add to the accolades he has already received for his scientific career.

According to its organizers, the Constantes y Vitales Awards aims to "recognize, support, and strengthen the research and prevention work of Spanish science and scientists in the field of health."

## 3. INNOVATION AND KNOWLEDGE TRANSFER

### 3.1. Patents and research management

**21**  
active

### 3.2. Innovation

The starting point of research into new drugs is to understand the real needs of patients and the mechanisms of the disease.

The first phases of discovery are carried out at the Cima Universidad de Navarra and their subsequent development is carried out with the help of pharmaceutical companies until these new drugs are made available to patients in the different care areas of the Clínica Universidad de Navarra Cancer Center.

In 2023, 53 collaboration agreements were reached to promote research and technology transfer.

**53**

agreements

### 3.3. Other strategic alliances

#### A cancer research agreement with the Weizmann Institute of Sciences

Cima and the Weizmann Institute of Sciences in Israel have signed a cancer research agreement. The objective of this agreement is to launch three pioneering biomedical projects that combine artificial intelligence, cutting-edge genetic technology, and advanced therapies. These projects are aimed at improving the treatment of lung and pancreatic cancer, two of the most lethal tumor types, and multiple myeloma, the second most common blood cancer.

The agreement was made possible thanks to the initiative and contribution of the Alberto Palatchi Foundation, a philanthropic organization with multiple purposes, including promoting biomedical research and technological innovation.

#### The CCUN joins the European Organization of Cancer Institutes

The European Organization of Cancer Institutes (OECI) has admitted the Clínica Universidad de Navarra Cancer Center as a new member, after it presented its candidacy at the annual assembly of the European institution, held in Paris.

The acceptance of the Cancer Center Clínica Universidad de Navarra into the OECI was a step required for its future accreditation by the same organization as an integral or comprehensive cancer center.

As Dr. Antonio González, director of the CCUN stated, "the OECI endorses the objectives of the European Plan to Fight Cancer, which is aiming to develop a network of comprehensive cancer centers throughout all the European Union countries by 2025 so that in 2030, the majority of patients who require specialized treatment can access one of these centers and thus, receive the most appropriate treatments in the fight against oncological pathologies."

**An alliance with Johns Hopkins to promote proton therapy training in Spain**

The Cancer Center Clínica Universidad de Navarra has reached a collaboration agreement with the Johns Hopkins Proton Therapy Center (Washington DC) to promote training and research in proton therapy among professionals in the Spanish National Health System. With this objective, it will offer training sessions through the Faculty of Medicine to improve research and treatments with radiotherapy technologies, with plans in the coming years to extend these treatments nationally.

Likewise, as part of this agreement, the Clínica Universidad de Navarra will reinforce specialized training of its oncologists, radiologists, physicists, dosimetrists, and biomedical engineers, with the implementation of learning and observation sabbaticals at the Johns Hopkins Proton Therapy Center facilities. In Washington, course participants will be able to learn about the American labs' equipment and working methods first-hand. In addition, they will delve into the fundamentals of proton therapy, clinical tests, and the most promising use indications that they can then apply in their own clinical practice.

**The first clinical study of selective stimulation of 4-1BB protein as an immunotherapy for advanced solid tumors, in conjunction with Roche**

Along with the pharmaceutical company Roche, the CCUN is leading a pioneering immunotherapy trial in patients with advanced solid tumors in which targeted activation of the novel protein 4-1 BB (RO7122290) by another target protein (FAP) has been tested. The results were published on the cover of the high-impact scientific journal *Science Translational Medicine* and show the ability of this type of treatment to stimulate an antitumor immune response.

Currently, more than 80% of patients do not adequately respond or show resistance to immunotherapy with monoclonal immunomodulatory antibodies. Thus, this research team opted to activate the 4-1BB receptor as a therapeutic option. The costimulatory activity of this protein in creating an antitumor immune response constitutes one of the main mechanisms under investigation to increase the effectiveness of treatments.

**A BMS-supported clinical trial shows that CART therapy improves survival of early relapsed multiple myeloma patients**

A phase III clinical trial has shown, for the first time, that CART lymphocyte therapy significantly prolongs survival in patients with multiple myeloma who had relapsed after 2-4 prior lines of treatment. This was the result of a clinical trial in which the CCUN participated, carried out in hospitals around the world and published in the New England Journal of Medicine.

The project, promoted by Bristol Myers Squibb, involved the participation of almost 20 national and international centers from 13 different countries, with the Clínica Universidad de Navarra Cancer Centre recruiting the most patients.

**Researchers, specialists, and students receive the 2022 grants from the AECC in Navarra**

**AECC LAB grant. Dr. Alvaro Teijeira.**  
To identify new ways to enhance the action of patient immune system cells against cancer to improve the effectiveness of immunotherapy.

**AECC Researcher Grant. Dr. María Arechederra.** Do develop and validate new liquid biopsy strategies for the early detection of liver cancer, which will allow earlier diagnosis and improve prognoses.

**Junior Clinical Grant in the Navarra Territory. Dr. María Marcos Jubilar.**  
To investigate how CAR-T cell treatment, and the secondary inflammation it produces, affects coagulation in order to identify parameters to optimize preventive treatment of these complications.

**Globalization Grant. Dr. Antonio González.** For research into personalized medicine in ovarian cancer thanks to an ERA PerMED grant, and to **Dr. Ignacio Melero**, to search for immunotherapy targets for liver metastases thanks to a TRANSCAN grant.

**Laboratory Experience Program Grant. Aitana Ortiz.** An intern student at the Cima Universidad de Navarra.

## 4. CLINICAL TRIALS

In 2023, 95 new clinical trials were managed and more than 1,000 CCUN patients were able to access a total of 469 studies. The trials recruited 445 new patients in 2023.

**Nuevo Cancer Center de la CUN; atención integral para el paciente oncológico**

Integra décadas de experiencia asistencial, investigadora y docente para tratar la patología con mayor precisión.

Cancer Center ha incluido avances como la puesta en marcha de la Unidad de Radioterapia y de la Unidad de Proctología. Adicionalmente, ha obtenido la certificación en España de la Sociedad Europea de Oncología en Cáncer de Mama (EUSOMA), para tratar la enfermedad con un convenio con la Universidad de Navarra que incluye la investigación y los ensayos clínicos.

Los 550 especialistas asistencia, profesionales de enfermería y de administración del nuevo Centro Clínica Universidad de Navarra atenderán a más de 1.000 pacientes al año. En 2021, se desarrollarán más de 1.000 proyectos de investigación y desarrollo de impacto y se cuenta con 404 ensayos clínicos activos.

El Cancer Center cuenta con 14 grupos de investigación y ya ha sido reconocido por el Centro de Excelencia de la Fundación Española para la Investigación Científica (FECYT) que evalúa la relevancia y el impacto de la investigación en Oncología. La Clínica Universidad de Navarra, con su vocación innovadora, su dinamismo y su compromiso con las mejores prácticas en su funcionamiento.

**Modelo con más de 50 años**

Los primeros centros de cáncer se crearon en Estados Unidos a partir de la Ley National Cancer Act de 1971. Hasta entonces, el National Cancer Institute (NCI) era el único centro de cáncer en todo el país, de los que solo existían 10. Los NCI se multiplicaron creando o mejorando los servicios de investigación y tratamiento del cáncer. El doctor San Miguel subraya que el modelo de NCI es el que más le convence, ya que este centro "se une más a la investigación que a la atención, pero incluyendo las mejores indicaciones de Estados Unidos".

Durante 2017, el proyecto del

## Investigadores del Cima y de la CUN revierten una causa del cáncer de la sangre asociado a la edad

El hallazgo abre la puerta al potencial tratamiento de este cáncer que afecta a cerca de 17.000 españoles

→ ABC → Salud → Enfermedades

### Avatares de ratón para tratar un cáncer de la sangre incurable

El estudio publicado en «Nature Medicine» abre una vía de investigación que podría expandirse a otros tumores sin curación

Cada año se detectan 3.000 casos de Mieloma Múltiple en España

Esta plataforma halla fármacos para la metástasis en cáncer

**LAS CAR-T SE CITAN EN EUROPA**

**EUROPA TOMA EL PULSO A LAS CÉLULAS CAR-T EN UN CONGRESO MONÓGRAFICO Y ELEGÁTICO QUE ABORDA LA TERAPIA DESDE DIFERENTES ÁMBITOS**

TEXTO SONIA MORENO

ORGANIZADO AL ALMÓN por la Asociación Europea de Hematología (EHA) y la Sociedad Europea de Trasplante Hematopoyético y Terapia Celular (EBMT), al Congreso Europeo sobre CAR-T han asistido más de mil profesionales más de ellos de manera presencial en Rotterdam (Países Bajos). Durante tres días, enfermeras, científicos, médicos, profesionales de la industria y pacientes han actualizado el conocimiento sobre la terapia avanzada desde diversos prismas. Es la quinta edición de este congreso monográfico y ya se sabe que habrá una sexta en Valencia, en marzo de 2024, como confirma a este medio la presidenta de la EPTM, Anna Sureddi.

Algunas mesas del congreso ilustran su carácter ecléctico. Por un lado, una sobre las dificultades de accesibilidad de las CAR-T en el mundo, con ponentes de Canadá, Brasil, Europa del Este, Sudáfrica e India. La hematóloga Miriam Sanchez Escamilla, en Santander, destaca a Diana, algunos de los estudios mencionados más relevantes

desde el punto de vista de la ciencia, como precisamente los ensayos Zuma-7 y Transform, que han permitido a los medicamentos CAR-T (zalcitabagene, ciloblastin, liso-cel) y doncabtagene ciloblastin, recibir la aprobación como tratamiento tras primera recidiva o refractariedad en Lymphoma no Hodgkin (LNH) y leucemia linfoblástica aguda (LLA).

Además, se contó con la visita de pacientes y sus familiares; en concreto, Emily, que sufre leucemia linfoblástica aguda, recibió de CAR-T para tratar una leucemia aguda linfoblástica aguda. Emily sigue en remisión completa más de diez años tras la infusión de las células.

Las sesiones de carácter clínico comenzaron con las indicaciones más consolidadas sobre las que se tiene más información. Anna Sureddi repasó el conocimiento en linfoma B de célula grande (LBCLG), haciendo hincapié en los últimos estudios presentados en la reunión de la Sociedad Americana de Hematología, y en concreto, sobre los potenciales factores pronósticos, a tener en cuenta para entender mejor por qué varían los resultados de eficacia y toxicidad en determinados pacientes, así como sobre la posibilidad de utilizar las CAR-T en segunda línea en poblaciones de pacientes mayores, entre otras específicas, ya sean candidatos a trasplante o no candidatos a trasplante, donde se están obteniendo resultados muy interesantes.

La hematóloga Miriam Sanchez Escamilla, del Hospital Universitario Marqués de Valdecilla, en Santander, destaca a Diana, algunos de los estudios mencionados más relevantes

del Hospital Universitario La Paz, en Madrid. En este proyecto, el LLIHC que se está llevando a cabo, se evalúa que el efecto combinado entre el uso de CAR-T y carboplatin genera una respuesta del 40%.

En hematología, casi todos los hematólogos están realizando publicaciones en The New England Journal of Medicine, con Paula Rodriguez-Gonzalo, del Centro de Investigación Clínica Universitaria de Barcelona, como primera firmante en el ensayo Zuma-7 dirigido a BCMA+ prolifera de forma significativa la supervivencia libre de progresión en comparación con las terapias estándard en refractarios con LNH en recidiva y retroceder de los cuatro tipos de tratamiento previos que habían recibido.

También en esa enfermedad hematológica, tienen de Soto, en el ensayo Zuma-7 y Transform, que han permitido a los medicamentos CAR-T (zalcitabagene, ciloblastin, liso-cel) y doncabtagene ciloblastin, recibir la aprobación como tratamiento tras primera recidiva o refractariedad en LNH y leucemia linfoblástica aguda (LLA).

La consideración de la inmunoterapia celular en estos patologías no se ha reproducido de modo similar en la leucemia aguda mieloblástica, donde Teresa de Soto recuerda que se está investigando en diferentes moléculas dirigidas hacia las que dirigen las células CAR-T.

Además, continúa de forma intensa la exploración de formas sólidas con CAR-T en tumores sólidos, como el glioblastoma, donde la investigadora Sotomayor trabaja en algunas líneas de Barcelona, y que se han comunicado en otros temas.

Entre otros temas, la presidenta del EBMT trae a colación la presentación de Marco Ruella, de la Universidad de Pensilvania, sobre los mecanismos de escape de los fracasos de las CAR-T que ayudan a entender por qué la tasa del 50% de los pacientes en las mejores condiciones no mejoran. En ese sentido, Anna Sureddi, en ese sentido, Anna Sureddi, abunda en la supervivencia de tres años de respuesta durante de 47,1%, lo que ha sido recordado por Miriam Sanchez, que se plantea en estos pacientes, quienes no cuentan con muchas opciones terapéuticas.

Teresa de Soto, hematóloga

**INDICACIONES EN EXPECTATIVA.**

"No obstante, es una indicación que todavía no podemos utilizar, pues aquí estamos pendientes de la aprobación de la Agencia Española del Medicamento (AEMPS)", ha matizado. En igual plazo CAR-T brexucabtagene aguda linfoma cel (Tecartus) ha sido aprobado en el marco, cuyos datos en el ensayo Zuma-2 indican que más de la mitad de los pacientes mantienen la respuesta continua a los tres años de seguimiento.

La especialista también alude al empleo de brexucabtagene aguda linfoma cel como tratamiento de la leucemia linfocítica aguda en recidiva o refractaria (LLA-B) de pacientes adultos mayores de 26 años. En la reunión se presentaron datos actualizados del ensayo Zuma-3, un estudio en seguimiento de un estudio en fase II que ha mostrado una tasa de respuesta durante de 47,1%, lo que ha sido recordado por Miriam Sanchez, que se plantea en estos pacientes, quienes no cuentan con muchas opciones terapéuticas.

Teresa de Soto, hematóloga

## 1,2 millones a la CUN para investigar la inmunoterapia en el melanoma

El programa CRIS financiará el trabajo del especialista del Cancer Center de la clínica Miguel Fernández

**PAMPLONA** – El especialista del Cancer Center la Clínica Universidad de Navarra Miguel Fernández de Sanmamed ha obtenido una ayuda de 1,25 millones de euros del programa CRIS de Excelencia para investigar la inmunoterapia en el melanoma y el cáncer de riñón.

El trabajo, señala el experto, pretende "desarrollar modelos traslacionales que puedan reproducir la interacción entre el sistema inmu-

ne de un paciente frente a su propio tumor", unos modelos que son "absolutamente esenciales porque a día de hoy no tenemos herramientas de este tipo que nos ayuden a refinar las mejores estrategias de inmunoterapia antes de aplicarlas en ensayos clínicos".

Gracias al programa CRIS tiene el objetivo a largo plazo de curar esta enfermedad promoviendo y financiando la investigación con fondos de la sociedad civil y por ello Mariano Barbacid, del Centro Nacional de Investigaciones Oncológicas y encargado de clausurar el acto, hizo un llamamiento a los donantes y reclamó "más financiación pública". – *Diario de Noticias*

## Diseñan una calculadora que identifica un grupo de pacientes oncológicos con mejor pronóstico

### El Cancer Center Clínica Universidad de Navarra lidera un ensayo pionero de inmunoterapia frente a tumores sólidos avanzados

Se trata del primer estudio clínico de la estimulación selectiva de la proteína 4-1BB como inmunoterapia frente a tumores sólidos avanzados. En el ensayo clínico han participado 115 pacientes a los que se ha administrado dosis semanales intravenosas de esta terapia como agente único o en combinación con Atezolizumab.

buscando extender el éxito de la inmunoterapia".

En el marco del Día de la Ciencia, la Fundación CRIS entregó ayer sus galardones anualmente a la investigación contra el cáncer por un valor cercano a los 10 millones de euros a catorce investigadores y dos unidades de investigación hospitalarias.

La Fundación CRIS tiene el objetivo a largo plazo de curar esta enfermedad promoviendo y financiando la investigación con fondos de la sociedad civil y por ello Mariano Barbacid, del Centro Nacional de Investigacio-

nnes Oncológicas y encargado de clau-

surar el acto, hizo un llamamiento a

## NUEVA OPORTUNIDAD PARA TUMORES HUÉRFANOS DE TERAPIA

**Oncología.** La proteína HER2 es una diana a la que se dirigen muchos tratamientos contra el cáncer de mama. Este mismo marcador podrá utilizarse a partir de ahora frente a otros tumores, como el de ovario o vejiga

Por Pilar Pérez (Chicago)

**E**n el cáncer, como en la vida, hay clases. No sólo de pacientes con más o menos probabilidades de vivir sino tumores más o menos famosos, que cuentan con más recursos en investigación. Sí, suena cruel, pero es así. «El cáncer de mama tiene un componente social muy importante», cuenta Miguel Martín, presidente de Geicam (Grupo Español de Investigación en Cáncer de Mama) y jefe de Oncología Médica en el Hospital Universitario Gregorio Marañón. «La figura de la mujer ha hecho que se hagan más esfuerzos. Además, ella participa más en los ensayos, se ocupa y preocupa de la enfermedad».

No obstante, las investigaciones en cáncer de mama han abierto la puerta a otros tumores, menos frecuentes, pero más agresivos y con menos opciones terapéuticas. En este caso, un marcador asociado al cáncer de mama, el HER2, se ha observado también en otros tumores. ¿Y si el HER2 está en más tumores que en el de mama podremos tratarlos de la misma forma a todos? La respuesta que han encontrado los investigadores ha sido positiva. ¿Con el mismo fármaco? Sí: en el Congreso de la Sociedad Americana de Oncología Médica

(ASCO) han presentado los resultados de un trabajo, el estudio Destiny-Pantumoro, que muestra cómo el empleo de un anticuerpo conjugado, trazuzumab-deruxtecan, se puede usar de forma transversal en varios tipos que tumores que comparten la sobreexpresión HER2, como los ginecológicos (endometrio, cérvix y ovario), genitourinario (vejiga), tracto biliar y páncreas, entre otros.

Algunos tipos de células cancerosas de estos tumores producen una serie de cantidades anormales de esta proteína. Se cree que esto provoca que las células malignas se multipliquen con rapidez, lo que les permite viajar y colonizar otras partes del organismo. Por ello, «medir la cantidad de esta proteína en algunos tipos de células cancerosas sirve para planificar el tratamiento», explica Antonio González Martín, director del Cancer Center Clínica Universidad de Navarra y uno de los participantes españoles en el estudio.

«Con este estudio vamos a

cambiar la práctica clínica porque

le vamos a dar una solución

terapéutica a un subgrupo infre-

cuento de pacientes», remarca,

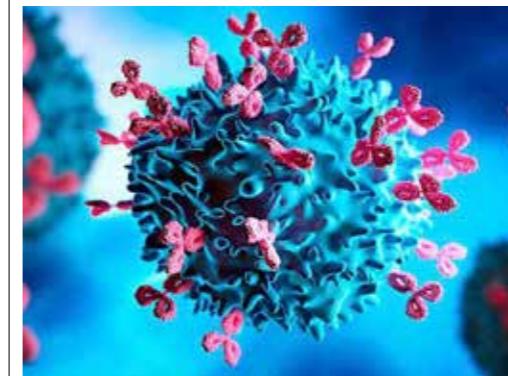

esperanzada, Aranzazu Manzano,

coordinadora clínica de la Unidad

de Terapias Experimentales en

Cáncer del Hospital Clínico San

Carlos de Madrid.

**Paula Rodríguez, hematóloga: «Sí que hay pacientes con mieloma que se curan»**

Paula Rodríguez, hematóloga del Centro de Investigación en Cáncer de la Clínica Universidad de Navarra.

La doctora considera que, en los últimos quince años, el abordaje

de esta enfermedad y su pronóstico ha cambiado completamente.

### Cáncer y protonterapia

**L**os avances en la medicina son importantes para tratar al nuevo paciente del siglo XXI. Uno que está empoderado, informado y que es partícipe de las decisiones que se tomen en su tratamiento. Uno de los últimos contra el cáncer es la protonterapia. Gracias a las propiedades físicas de los protones, esta terapia es, en la actualidad, la técnica radioterápica más avanzada y segura para tratar determinados tipos de cáncer. Aplicados en dosis específicas, los protones pueden actuar con precisión en el interior de los tejidos, consiguiendo un mayor efecto tumoricida y una mayor protección del tejido sano.

Para abordar las últimas novedades en este ámbito Madrid acogió la 61ª edición de la reunión anual del Grupo Cooperativo de Terapia de Partículas (PtCog, en sus siglas en inglés). En él participaron más de 1.300 profesionales de 54 países. Tal y como señaló durante su inauguración el Dr. Alejandro Mazal, jefe del Servicio de Física Médica del Centro de Protonterapia Quirónsalud, «estamos orgullosos de que Madrid acoja esta reunión de primer nivel, ya que, con la apertura de nuevos centros prevista en España para los próximos años, nos vamos a convertir en uno de los países con más número de centros por habitante, lo que nos permitirá facilitar el acceso a más pacientes y seguir acumulando evidencia científica sobre sus beneficios».

Ala inauguración oficial del congreso acudieron el presidente del PtCog, Marco Durante, y representantes del Centro de Protonterapia Quirónsalud y el Cancer Center Clínica Universidad de Navarra, que participan como co-organizadores del congreso dado que actualmente son los únicos centros que cuentan con esta tecnología en España. Además, se impartieron cursos de formación intensiva pensados tanto en los nuevos proyectos de unidades o centros de protonterapia de España como a la hora de favorecer el acceso a profesionales de América Latina, donde esta terapia también comenzará a utilizarse en los próximos años.

### THE OBJECTIVE

### Descubren cómo se forma y evoluciona la leucemia

El hallazgo abre nuevas vías para el desarrollo de tratamientos contra esta patología

### Investigación

Descubren una de las causas de resistencia a la inmunoterapia del cáncer de pulmón más frecuente

Adrián Gallego y Luisa Marmolejo, Investigadora en ECOHNC en el CIMA
